

Research results open access

📅 2022/12/13

Researchers funded by RJ must publish their research results open access. The requirement applies to peer-reviewed scientific publications in journals and conference reports.

RJ's open access policy does not yet include monographs or book chapters. However, RJ would like to encourage researchers to publish those open access as well. Through the platform Kriterium, researchers can have their monographs scientifically reviewed and make it openly available.

Include all additional costs for the publication when you apply for a grant from RJ.

Choose one of the following alternatives to make the research results openly available:

- **Publish in a journal or a platform open access**

There are many open access journals and publication platforms that use experts to assess the quality of the articles.

- **Publish in hybrid format**

A hybrid journal is a traditional subscription-based journal that offers authors the option to publish open access in exchange for a fee (see below about agreements with the large journal publishers). Many international publishers offer a corresponding service for books.

- **Self-archiving in a freely accessible archive**

Nearly all Swedish higher education institutions have an open digital archive. When the article or book has been published in a journal or by a publisher, the researcher may save a copy in the higher education institution's open archive. The copy saved must be a version with identical content to the original publication. RJ does not require the self-archived article/book to have the same layout as the journal or the publisher. If the article/book is also published in a non-open access way, there must be no more than twelve months difference (embargo) between the open and the non-open access publication.

Existing agreements on open access

Open access has been negotiated with the major publishers. Therefore, researchers do not have to pay an article processing charge (APC) to fulfil our requirement for open access when you publish articles in many of the journals. Publication is done under CC-BY licence according to most of the agreements,

License for publication

Publish under a license that allows others to access and use the research results. Researchers who pay a publication fee (article processing charge, APC) to publish an article open access must publish under a Creative Commons license, version CC-BY. Under the terms of such a license,
